Functional description

General

The CET4 is a guard locking device according to EN ISO 14119 using the open-circuit current principle. In this example, guard locking is controlled by a standard output from a Siemens control system. The two safe outputs of the CET4 are connected to a safe input of an ET 200S.

Connections

Designation	Function	Use in this example
OA, OB	Safety outputs. HIGH when the safety guard is closed and locked.	Switch-off of at least one of the outputs must lead to shutdown of the machine or installation via the connected control system. Important: The actual shutdown of the energy which is causing a hazard in a machine is not shown in the example and must be supplemented.
IA, IB	Inputs for series connection of AR devices from EUCHNER.	Connected to 24 V DC; function is not used.
+UCM, OV (UCM)	Control input for guard locking solenoid. Connect guard locking to 24 V DC to close.	Controlled by a standard output of ET200S. OV (UCM) connected to GND. Important: According to EN ISO 14119, it shall be ensured that the hazard caused by a machine has disappeared before the guard locking can be released.
OUT	Monitoring output. HIGH when outputs OA and OB are switched on (safety guard closed and locked).	Connected to a standard input of the ET 200S.
OUTD	Door monitoring output. HIGH when the actuator is within the operating distance and the CET is ready to engage guard locking (safety guard closed).	Connected to a standard input of the ET 200S.
LED1	Input for controlling the installed red LED	Controlled by a standard output of ET200S (see Figure 1).
RST	Input for resetting the switch	Connected to ground; function is not used.
J	Teach-in input	Only for ID No. 111683. The corresponding input must be connected to 24 V DC for actuator teach-in (for this purpose, see the operating instructions ¹⁾ . Important: for teach-in operation terminal OV (UCM) has to be connected to OV not to a different potential or to an output. The input must be unconnected during operation
–	Input not connected	Only for ID No. 111684, 113609, 113767, 114712 This input must always be connected to GND.

1) You can find the current operating instructions on the Internet at www.euchner.de. Simply enter the order number into the search field.

Safety assessment

The CET4 features complete monitoring for faults in the safety-relevant parts and in the connected cables (clock pulses at outputs OA and OB). With the device's own pulsing, switch-off or non-connection of the clock signals from the control system's safe inputs does not lead to a reduction in the PL. The example achieves PL e in accordance with EN ISO 13849-1 for the interlocking of a guard.

In exceptional cases in accordance with the risk assessment, guard locking can also be used for safety-relevant purposes. More detailed information about this can be found in EN ISO 14119. In this case, locking mechanism position monitoring of guard locking also meets the requirements of PL e.

A safety assessment for control of guard locking is not part of this example and must be supplemented for the respective machine by the design engineer in accordance with the risk assessment.

Parameter assignment in the control system

Input 4/8 F-DI

This parameter assignment applies only for the following assemblies:

- 6ES7138-4FA03-0AB0
- 6ES7138-4FA04-0AB0

Parameter	Value
F-Parameter	Corresponding to the use in Profibus/Profinet
Input delay	3 (ms) or longer
Short-circuit test	Cyclic
Behavior after channel faults	Optional
Sensor supply	External
Evaluation of the sensors	1oo2 evaluation
Type of sensor interconnection	2 channel equivalent
Other parameters	Optional

Figure 2

Input 4/8 F-DI (continued)

This parameter assignment applies only for the following assemblies:

- 6ES7138-4FA00-0AB0

Parameter	Value
F-Parameter	Corresponding to the use in Profibus/Profinet
Input delay	3 (ms) or longer
Short-circuit test	Lock
Behavior after channel faults	Optional
Evaluation of the sensors	1oo2 evaluation
Type of sensor interconnection	2 channel equivalent
Other parameters	Optional

Figure 3

Important note – please observe carefully!

This document is intended for a design engineer who possesses the requisite knowledge in safety engineering and knows the applicable standards, e.g. through training for qualification as a safety engineer. Only with the appropriate qualification is it possible to integrate the introduced example into a complete safety chain.

The example represents only a part of a complete safety chain and does not fulfill any safety function on its own. In order to fulfill a safety function, the energy switch-off function for the hazard location and the software within the safety evaluation must also be considered, for example.

The introduced applications are only examples for solving certain safety tasks for protecting safety guards. The examples cannot be comprehensive due to the application-dependent and individual protection goals within a machine/installation.

If questions pertaining to this example remain open, please contact us directly.

In accordance with Machinery Directive 2006/42/EC, the design engineer of a machine or installation is obligated to perform a risk assessment and take measures to reduce the risk. When doing this, the engineer must comply with the applicable national and international standards. Standards generally represent the current state of the art. Therefore, the design engineer should continuously inform himself about changes in the standards and adapt his considerations to them. Relevant standards include EN ISO 13849 and EN 62061. This application must be regarded only as assistance for the considerations about safety measures.

The design engineer of a machine/installation is obligated to assess the safety technology himself. The examples must not be used for assessment, because only a small excerpt of a complete safety function was considered in terms of safety engineering here.

In order to be able to use the safety switch applications correctly on safety guards, it is indispensable to observe the standards EN ISO 13849-1, EN ISO 14119 and all relevant C-standards for the respective machine type. Under no circumstances does this document replace the engineer's own risk assessment, and it cannot serve as the basis for a fault assessment.

Particularly in case of a fault exclusion, it must be noted that this can be performed only by the design engineer of a machine or installation and requires a reason. A general fault exclusion is not possible. More information about fault exclusion can be found in EN ISO 13849-2.

Changes at products or within assemblies from third-party suppliers used in this example can lead to the function no longer being ensured or the safety assessment having to be adapted. In any event, the information in the operating instructions on the part of EUCHNER, as well as on the part of third-party suppliers, must be taken as the basis before this application is integrated into an overall safety function. If contradictions should arise between the operating instructions and this document, please contact us directly.

Use of brand and company names

All mentioned brand and company names are property of the respective manufacturers. The use is only for clear identification of compatible peripheral devices and environment of operation in combination with our products.
